Acronyms and Abbreviations xiii

Frequently used symbols xv

1 Introduction 1
- 1.1 Overview of video compression . . . 1
  - 1.1.1 Definition and significance . . . 1
  - 1.1.2 Basic structure . . . 2
  - 1.1.3 Video coding standards . . . 5
- 1.2 Scope of the present PhD thesis . . . 5
  - 1.2.1 Definition of an intra subpartitioning method . . . 5
  - 1.2.2 Main contributions . . . 6
- 1.3 Academic publications . . . 6
- 1.4 Contributions to the standardization of VVC . . . 7
- 1.5 Organization of the document . . . 9
- 1.6 Other aspects . . . 9
  - 1.6.1 Experimental framework used for the simulations . . . 9
  - 1.6.2 Conventions used in this document . . . 10

2 Background 11
- 2.1 Introduction . . . 11
- 2.2 Block structure in VVC . . . 11
- 2.3 Coding of luma intra-predicted blocks in VVC . . . 12
  - 2.3.1 Prediction . . . 13
  - 2.3.2 Transform . . . 17
  - 2.3.3 Quantization and residual coding . . . 18
- 2.4 Intra mode estimation in VTM for the luma component . . . 19
- 2.5 Related work on intra subpartitioning methods . . . 20
  - 2.5.1 Line-based methods . . . 20
  - 2.5.2 Residual Quad-Tree . . . 22
  - 2.5.3 Short Distance Intra Prediction . . . 22
  - 2.5.4 Proposals considered during the standardization of VVC . . . 24

3 Theoretical foundations **25**
3.1 Introduction . . . 25
3.2 The coding gain . . . 25
3.2.1 One-dimensional case . . . 26
3.2.2 Two-dimensional case . . . 29
3.3 The stationary model . . . 31
3.3.1 Residual autocorrelation and transform selection . . . 32
3.4 A non-stationary edge model . . . 34
3.4.1 Vertical edge . . . 35
3.4.2 Horizontal edge . . . 39
3.4.3 Problems associated with the KLT solution . . . 45
3.5 A subpartitioning alternative for the edge model . . . 46
3.5.1 Residual autocorrelation of the edge model when ISP is used . . . 48
3.6 Performance of ISP over the conventional method . . . 51
3.6.1 Summary of the two methods . . . 52
3.6.2 Particular cases of the coding gain . . . 53
3.6.3 Results for different parameter values . . . 56
3.7 Summary of the chapter . . . 64

4 The Intra Subpartition method **65**
4.1 Introduction . . . 65
4.2 Layout . . . 65
4.2.1 Constraints on the number of subpartitions . . . 66
4.3 Subpartition coding process . . . 68
4.4 Intra prediction . . . 68
4.5 Processing order . . . 69
4.5.1 The normal order and its shortcomings for ISP . . . 69
4.5.2 The reversed orders . . . 70
4.5.3 Summary of the definition of the processing orders . . . 73
4.5.4 An implementation of angular intra prediction for the RPO reusing the existing angular modes . . . 74
4.6 Transform Selection . . . 77
4.6.1 Primary transform selection . . . 77
4.6.2 Secondary transform selection . . . 80
4.6.3 Relationship with Transform Skip . . . 81
4.7 Coefficient Coding . . . 82
4.7.1 CBF context selection . . . 82
4.7.2 CBF value inference . . . 83
4.7.3 Coordinates of the position of the last significant coefficient . . . 85
4.7.4 Coefficient Group shapes . . . 85
4.8 Experimental conditions and encoder estimation . . . 86
4.9 Coding efficiency analysis of the number of subpartitions . . . 87
4.9.1 Only one combination per block . . . 88
4.9.2 Two combinations per block . . . 89
4.9.3 More than two combinations per block . . . 90
4.9.4 Additional versions . . . 93
4.10 Analysis of the results of the best version . . . 95
4.10.1 Evaluation of individual aspects of the algorithm . . . 97
4.11 Summary of the chapter . . . 99

5 Decoder simplifications **101**
5.1 Introduction . . . 101
5.2 Analysis of hardware-related issues . . . 101
5.3 Modifications to reduce the complexity . . . 103
5.3.1 Solution to **Issue 1**: very small subpartitions . . . 103
5.3.2 Solution to **Issue 2**: very short subpartition widths . . . 104
5.3.3 Solution to **Issue 3**: additional memory requirements of the RPO . . . 106
5.4 Other simplifications . . . 107
5.5 Empirical results . . . 107
5.5.1 Average results of all versions . . . 107
5.5.2 Full results of the highest gain version . . . 111
5.5.3 Impact of the individual simplifications . . . 112
5.6 Summary of the chapter . . . 113

6 Encoder Optimization **115**
6.1 Introduction . . . 115
6.2 The purpose of the encoder search . . . 115
6.3 The VTM encoder search for intra-predicted luma blocks . . . 116
6.3.1 Coding tool parameters of the search . . . 116
6.3.2 Selection of the RD cost candidates . . . 117
6.3.3 Structure of the estimation process . . . 118
6.4 The main challenge of the ISP search . . . 118
6.5 The ISP search . . . 120
6.5.1 Structure . . . 120
6.5.2 Intra mode selection . . . 121
6.5.3 Order of the ISP tests . . . 122
6.5.4 Early termination of an ISP test . . . 127
6.5.5 Skip ISP tests based on previous tests . . . 130
6.6 Other fast algorithms related to the ISP search . . . 135
6.6.1 Skip ISP tests based on the non-ISP performance . . . 136
6.6.2 Skip ISP tests based on the result of a related block . . . 137
6.6.3 Skip remaining non-ISP transform tests based on the ISP performance 138
6.7 Summary of the optimized ISP encoder search . . . 138
6.8 Empirical results . . . 139
6.8.1 Average results of all versions . . . 139
6.8.2 Analysis of the trade-off results . . . 143
6.8.3 Full results of the two selected versions . . . 148
6.9 Summary of the chapter . . . 151

7 Statistics **153**
7.1 Introduction . . . 153
7.2 Utilization of ISP . . . 154
7.3 Intra mode utilization . . . 155
7.4 Block size utilization . . . 155
7.5 LFNST utilization on ISP blocks . . . 162
7.6 Utilization of the ISP combinations . . . 163
7.6.1 Split type utilization . . . 165
7.6.2 Number of subpartitions utilization . . . 170
7.7 Joint utilization of the ISP combination, intra mode category and aspect ratio 172
7.8 Relative frequency distribution of the CBF compositions . . . 174
7.9 Summary of the chapter . . . 178

8 Further studies **179**
8.1 Introduction . . . 179
8.2 ISP using intra modes derived at the decoder . . . 179
8.2.1 The template-based DIMD method used . . . 180
8.2.2 Utilization of DIMD for ISP blocks . . . 183
8.2.3 Empirical results of the ISP-DIMD combination . . . 183
8.3 An ISP layout for localized residual energy blocks . . . 186
8.3.1 Overview of the Spatially Varying Transform (SVT) . . . 187
8.3.2 Integration of the SVT within the ISP architecture . . . 188
8.3.3 Empirical results of the ISP-SVT combination . . . 190
8.4 Joint optimization of the CBF values . . . 192
8.4.1 Description of the experiment . . . 192
8.4.2 Empirical results . . . 193
8.5 An ISP implementation for lossless coding . . . 194
8.5.1 Enabling ISP for lossless coding . . . 195
8.5.2 Optimization of the ISP encoder search for lossless coding according to the SAD-based cost . . . 197
8.6 Summary of the chapter . . . 199

9 Conclusions **201**

A Layout structures **203**
A.1 One and two combinations per block size . . . 203
A.2 More than two combinations per block size . . . 215
A.3 Additional versions . . . 216

Bibliography **219**
