

Contents

1	Introduction	1
1.1	Aim and Scope of This Work	3
1.2	Organization of This Work	3
2	Fundamentals of Multi-Energy System Modeling and Optimization	4
2.1	Power System Analysis	4
2.1.1	The Power Flow Problem	4
2.1.2	The Newton-Raphson Method	6
2.2	Modeling of Multi-Energy Systems	6
2.2.1	Aggregation Concepts	7
2.2.2	Model Types	8
2.2.3	Modeling Framework	9
2.3	Optimization of Multi-Energy Systems	10
2.3.1	Approaches	11
2.3.2	Optimization Problem Formulation	12
3	Modeling and Optimization of National-Level Multi-Energy Systems: Decarbonization of China's Energy System	14
3.1	Introduction	14
3.2	Methodology	16
3.2.1	Modeling	16
3.2.2	Multi-Period Planning with Myopic Investment Foresight	17
3.3	Input Data	18

3.3.1	Provinces and Network	18
3.3.2	Electricity and Heat Demands	18
3.3.3	Electricity and Heat Supply Technologies	21
3.3.4	Carbon Budgets	26
3.4	Results	28
3.4.1	Cumulative Costs	28
3.4.2	Transition	30
3.4.3	Provincial-Level Results	33
3.4.4	Hourly Resolved Results	35
3.5	Discussion	38
3.6	Conclusion	39
4	Modeling of District-Level Multi-Energy Systems: An Integrated Power Flow Analysis	40
4.1	Introduction	40
4.2	Modeling	42
4.2.1	District Heating Network	42
4.2.2	Natural Gas Network	51
4.2.3	Coupling of the Electric, Gas, and District Heating Networks	53
4.3	The Newton-Raphson Solution	53
4.4	Case studies	55
4.4.1	Four-Bus Illustrative Case Study	55
4.4.2	CIGRE Twelve-Bus Application Case Study	57
4.5	Supplementary Analysis for Leakage Scenarios	61
4.5.1	Strategy	61
4.5.2	Power Flow Equations	62
4.5.3	State Variables	63
4.5.4	Test case	63
4.6	Conclusion	65
5	Optimization of District-Level Multi-Energy Systems: An Iterative Linear Pro-	

gramming Approach	67
5.1 Introduction	67
5.2 Modeling	69
5.2.1 Electric Network	69
5.2.2 District Heating Network	70
5.2.3 Aggregated Nodes	72
5.3 Iterative Linear Programming of the Integrated Network	72
5.3.1 Initialize Parameters	73
5.3.2 Optimization of the Linear Model	73
5.3.3 Update Parameters	75
5.3.4 Solve a Base Power Flow	76
5.3.5 Linearize the Power Flow Constraints	77
5.3.6 Set Variable Limits	77
5.3.7 Optimization of the Linearized Model	78
5.3.8 Post Process of the Optimization	78
5.3.9 Update Variables	78
5.4 Case Study	79
5.4.1 Input Data	79
5.4.2 Results	82
5.5 Discussion	93
5.6 Conclusion	94
6 Conclusions	96
A Terminology	98
A.1 Symbols	98
A.1.1 Upper Case Letters	98
A.1.2 Lower Case Letters	99
A.1.3 Greek Letters	100
A.1.4 Subscripts	100
A.1.5 Superscripts	101

A.2	Acronyms	101
B	Assumptions	103
B.1	Assumptions for Modeling of Multi-Energy Systems at National Level	103
B.2	Assumptions for Modeling of Multi-Energy Systems at District Level	104
B.3	Assumptions for the Case Study of the Iterative Linear Programming	105
C	Supplementary Information	106
C.1	Supplementary Information of Chapter 3	106
C.1.1	Overview	106
C.1.2	Validation	106
C.1.3	Supplemental Results	108
C.1.4	Supplemental Scenario	109
C.1.5	Supplementary Data	111
C.2	Supplementary Information of Chapter 4	115
C.2.1	Four-Bus Illustrative Case	115
C.2.2	CIGRE Twelve-Bus Application Case	115
C.2.3	Leakage Scenario Test Case	116
C.3	Supplementary Information of Chapter 5	117
D	Bibliography	118
